

# Category Learning in the Peripheral Vision

---

Paloma Alvarez, Vanessa Gomez, and John Vallada

Mentor: Luke Rosedahl

Advisor: Greg Ashby, Ph.D.

# Motivation

---

Everyday we make category judgments

# Project Goals

To determine if the left and right visual fields are trained independently during categorization

# Experimental Method

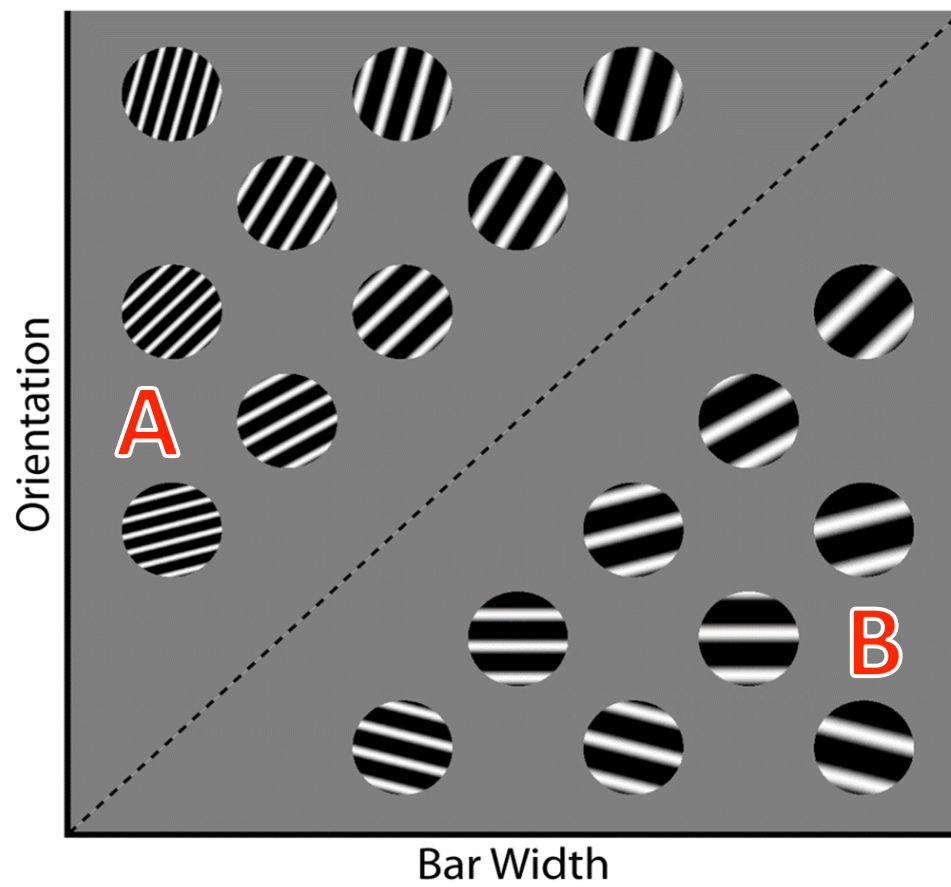

---

Gabor Disc

- Learn to categorize discs into one of two categories
- Discs will vary on two different dimensions

Left

A

B

Right

B

A

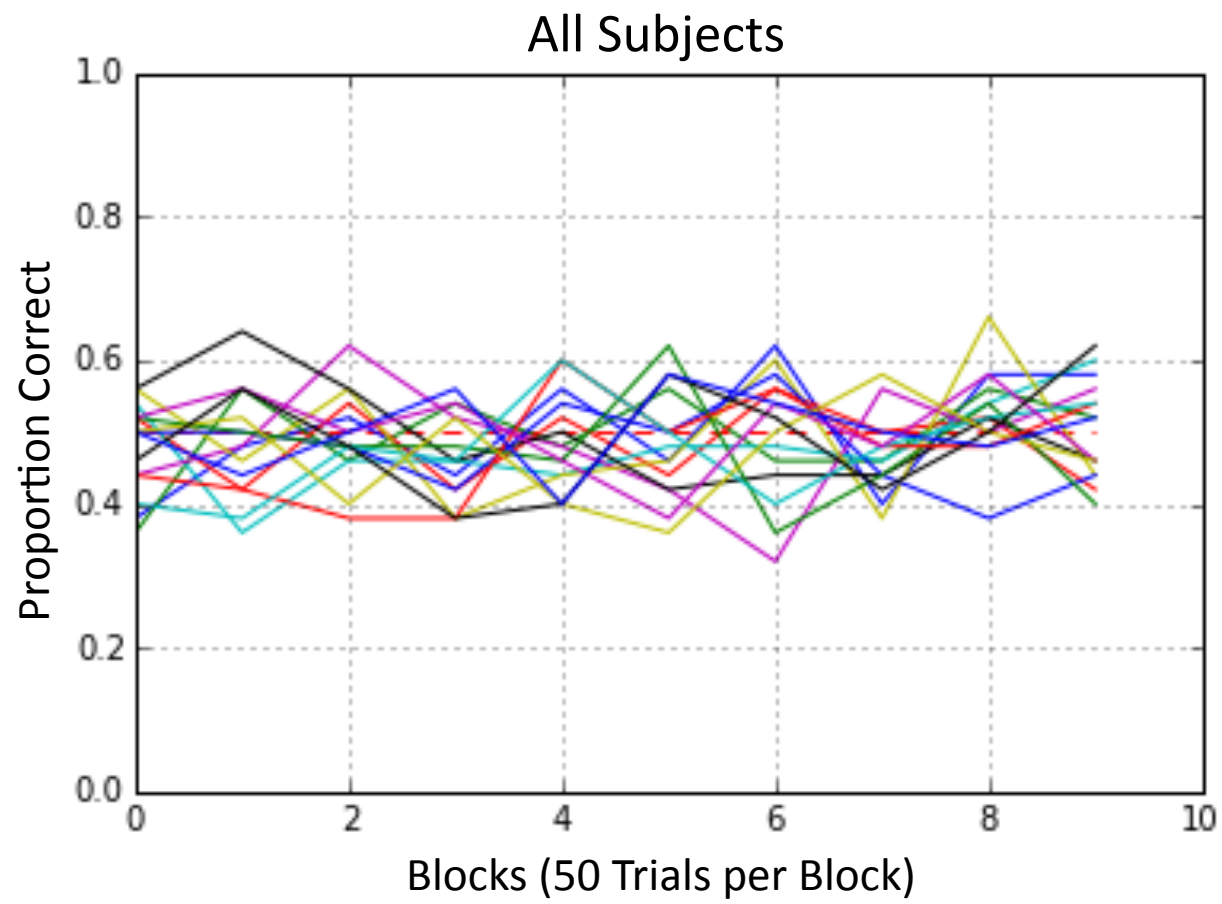

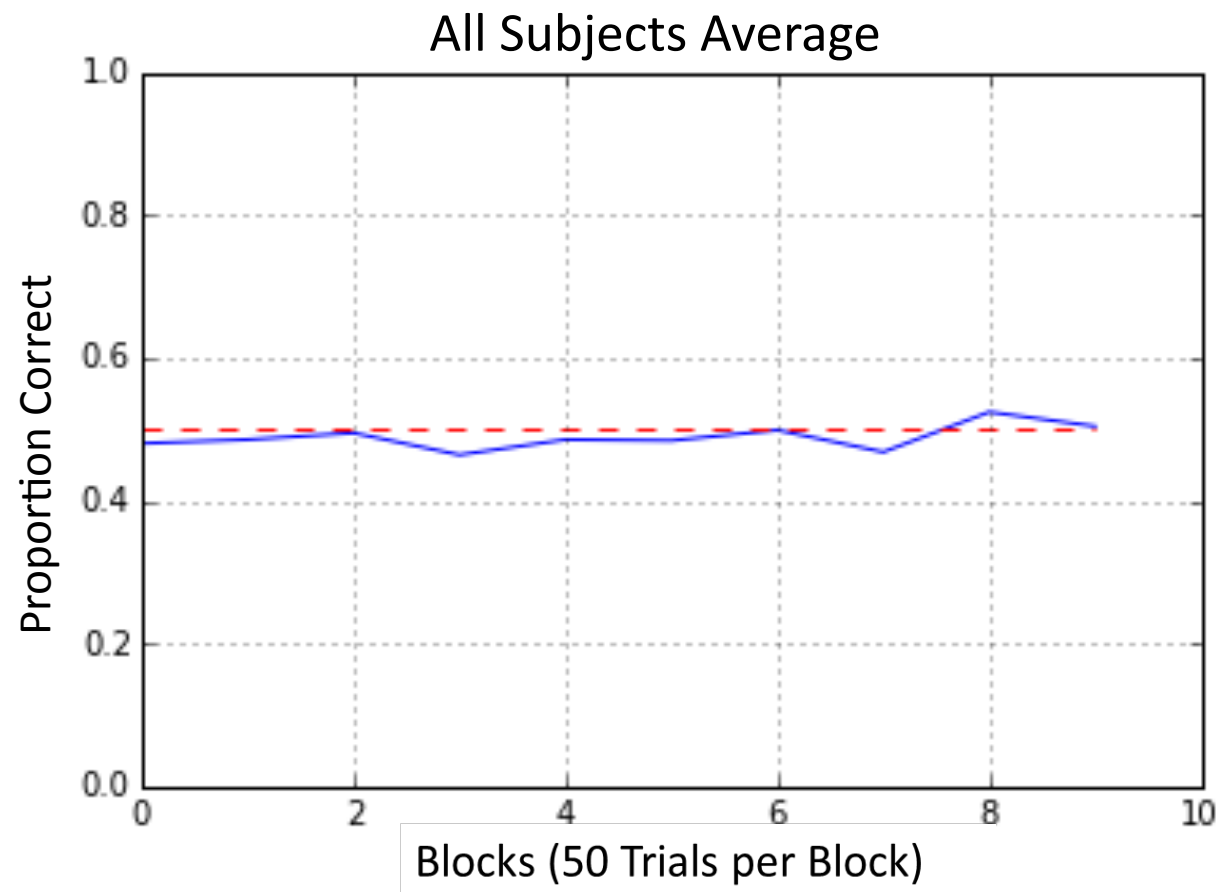

## Data (delete slide) say for next slide

---

- 17 subjects
- Around 45 minutes
- 10 blocks of 50 trials
- 500 trials

## Discussion & Conclusion

---

- Data did not support left and right visual fields being trained independently
- Likely conclusion, left and right side are not trained 100% independently

# Future Directions

---

- Eye Tracker
  - Train them on right visual field for 500 trials
  - Test on right and left visual fields
  - If performance is poor on the left side it would imply there is somewhat independent training

# Summary

---

- Learned about categorization
- The importance of research and remodifying experiments
- Amazing opportunity to work with mentors!
